Potato chip external application prevention and treatment

Observation on the effect of swelling and induration after vaccination
Ruan Static, Shawkinland, Wu Fang

Abstract: MeshTo investigate the effect of potato slices on the prevention and treatment of redness and induration after vaccination.
Smoketch400Children's preventive effect view of vaccinationThe object, randomly divided into control group and Prevention group 200 Cases, the control group was not treated with anyPre -After inoculation, fresh potato slices were inoculated.After vaccinationredness and swellingHardThe affected species of the knot120Example for therapeutic efficacy Observation Object, with machine divided into two groups, governing therapy 1 Group 60 Routine hot and humid compress, treatment Therapy 2 Group 60 Give fresh potatoes For exampleTopical treatment.[knotFruit] prevent therapeutic observation, prevent group redness and swelling rate as0.5%RightAccording to the group 2.0%, the therapeutic effect of the observation of the, treatment Therapy 2 Group after treatment 1d. 3d. 7DThe cure rate of redness was 61.7% . 85.0% And93.3%, Ming Significantly higher than treatment 1 Group (18.3% . 51.7% And80.0%) , The difference is statistically significant. (PThē0.05).

Keywords: the seed Vaccine; Dirt Bean Patch External; Pre - Anti -; Red Swelling

The general reaction occurs after vaccination with redness and swelling . The highest proportion of induration,

1. Information and methods

1.1 A-like capital material ① Select Optional 2014 Years 4 Month — 2015 Years 4 Month
About the author Ranjing, In charge of the nurse, Unit: 510760, Guangdong province Guangzhou Huangpu District Red Cross Medical Hospital; Shawkinland, Wu Fang Unit: 510760, Guangdong province Guangzhou

Huangpu District Red Cross Hospital.
Children who are vaccinated in the preventive health care section of our hospital illustrate that the prevention effect of the image, its male 209 cases, female 191 cases, age 3 months to 36 months, randomly divided into control group and prevention group each 200 cases. Two groups in a induration diameter, red swollen area, age distribution, do not wait more. Differences without statistical significance (P > 0.05).

1.2 Method

General Care 2015 Years 12 Month The 13 Volume The 36 Period (total The 381 Period)

1.2.1 Methods of prevention and intervention The control group inoculated children without any intervention; Pre-Anti-group with dirt bean slice External Application Method, wash the fresh potatoes clean skin, and then cut into thickness of 1.5 mm ~ 3 mm, surface product 5 cm x 5 cm size the thin, reset dirt beans Thin movie on note shoot Bit, and bind play "" Band SolidSet, To prevent potato slices from being injected with the bit, minute 1 times, every day repeat 3 times, continuous 2 days.

1.2.2 Therapeutic interventions Treatment 1 The method of applying damp heat to the group, in redness and swelling, place a warm damp towel on the induration site (38 °C ~ 40 °C) and hot water bag (40 °C ~ 45 °C), every time 15 minutes, every day heavy re 3 times, even continued application to redness and swelling, hard knot dissipation; Governance Therapy 2 The group uses potato chips External Application Method, wash the fresh potatoes clean, peel, cut and cut into thickness of 1.5 mm ~ 3 mm, surface product 5 cm x 5 cm size of the sheet, original for hot and humid surface product slightly larger than redness, induration area will be inflamed, induration site processing to clear Jie Hou, cover potato slices and fixed with elastic bandages, every 20 minutes, repeat daily 4 times, continuous external application until swelling and induration disappear.

1.3 Criteria for the determination of curative effect ① Preventive effect Observation, Full observation and record, record the two groups of swollen locally, observation time 1 day ~ 3 days. View

Observing standards: Inoculation Whether the area appears redness and induration. It's Treatment Effect Observation, treatment time 1 day ~ 7 days. Treatment 1 day ~ 3 days, 7 days after measuring hard knot size, observation skin skin play sex and no good anti-should, view observe the healing effect. Pro Bed Cure: Induration, redness and disappearance, no pressure pain, Local muscle shells sexual recovery Good; Explicitly Effect: Hard Knot, Red Swollen face product Ming show minus Less, reducing less to original face product 40% and the following. The contact is softer than before.; Invalid: Induration. Red Swollen area reduced no significant change, or slow down.

1.4 Statistical analysis Data used SPSS 19.0 For statistical split Analysis, Count Number of capital material should with Χ² Check enter line more than, check check superscript Alpha = 0.05, statistically significant for the difference.

2. Results

Table 1 Comparison of two groups of induration occurred in the prevention of curative effect Cases (%)

| Group | Example | induration induration Control group 200192 (96.0) 8 (4.0) |

3. Discuss
Vaccination is an effective way to prevent many infectious diseases in clinicMethod,Babies and children. A variety of immunization programmes are required according to national regulations. Vaccination significantly reduced hepatitis B, HundredDay cough, WhiteThroat, BrokenInjury Wind. The incidence of a variety of diseases, Yes Effect increases the overall health of children's waterFlat. Mostly intramuscular injection, Most Common adverse reactions are Pain in the plant area, Red Swelling and induration. Itch. Current, In Our Hospital With type door diagnostics vaccination to prevent redness and swelling reaction frequency is higher, High hoccurs Rate requires more effective treatment. Current, Right injection Site Red Swelling and induration, P Hot compress treatment is mainly adopted in the bed, fromLine fades, etc., However, the effect The fruit is often not satisfied, Easy to inflict two times of pain.

The swelling and induration of drug injection site is more common in clinical nursing, More with drugs Thorn Excited, DifficultTo suck accept drug things to points etcb19> Vegetarian has Off. And Chinese Medicine believes that qi stagnation and blood stasis is likely to lead to swelling of the site and hard The important reason of knot. Traditional Chinese Medicine believes, Soil beans in Clinical theory With has multiple effects, Fiber Dimension Delicate, Outside To poison with a loose scar, Make Vascular soft Of; With When, Horse Bell potato with have small amount long kwai alkali Of, With Extinction Inflammatory, Kill Bacteria effect Fruit; Other Outside, Also can block stop blood tube tight Zhang Vegetarian I To blood tube tight Zhang Vegetarian II (AnG ii ) Turn Of, Shu Zhang Week blood Tube, Yes Benefits on suction Accept waterswollen [3,4] .

So, Fresh without mildew, Potato chips with long buds Pain, Extinction Swollen, Solution The role of Poison, and the economy, Convenient. Continuous external application promotes muscle Meat Fiber Restore effect Explicitly, Hard Knot, Red Department bit pertime after external application feel comfortable Adequate, Hurt Pain Ming Show minus Light, Hard Knot Bureau limit Speed degree Fast; With When, New Fresh no mildew Change, The potato chips with long buds are very rich in starch, Solanum nigrum Alkali and cholesterolalkane derivative Eggplant and alkali, can intervenein the body's carbon-water combination, protein and grease fatty new Chen metabolism, Local compress and speed up blood flow pass, Aids Culture Bureau Department group Fabric, Enhancing absorption of local medicine Objects, to achieve the work of dispersing and swelling effect [5].

The research uses the potato slice to inject the vaccine injection site, Knot Fruit Shown, Early use of soil Bean Slice topical therapy can effectively prevent local swelling and hard Knot formation; While, Right the formation of redness caused by vaccination Hard Knot, Effect of treating swelling and dispersing with potato slices with external application, and does not appear poison Vice Should, Early availability in swelling and induration reactions, quickly drop Low child's The feeling of searing and aching, Slow down the formation of induration also gives Protect. The work brings great convenience, It is recommended that clinical nursing staff in infants and children Children vaccinated, Potato chips should be used locally as early as possible to prevent hard Formation of knots, and Once the swelling is found, Hard Knot, More Should be used as early as possible Methods to reduce the pain of children vaccinated early.
